Introduction to Photoshop

Image adjustment (size, cropping, rotating, color, contrast) Image Manipulation

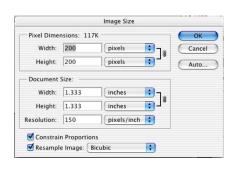

- Selection, Layers
- Combination: copy, paste, layers
- Painting: text, color, pattern, erase, clone, shape
- Processing: Filters, Actions

Image Size and adjustments

Go to **Image—Adjustments** submenu to alter contrast/brightness, color balance, etc.

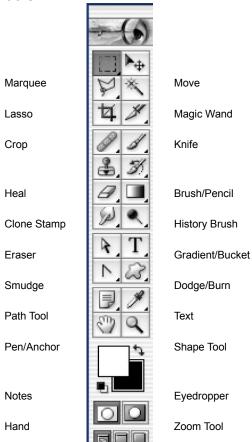

Go to **Image Size** to adjust size of image and resolution

Tools

Foreground /Background

Palettes (to view, go to Windows menu)

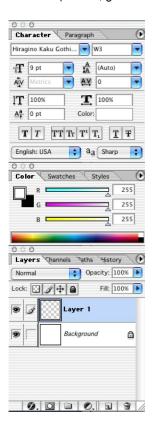

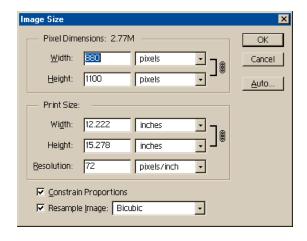

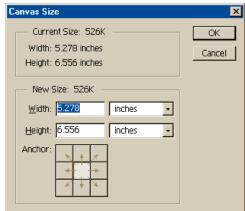

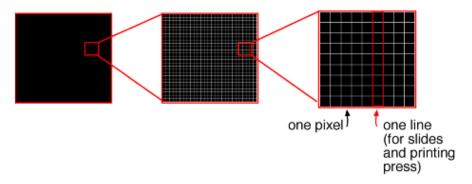

Image size and Resolution

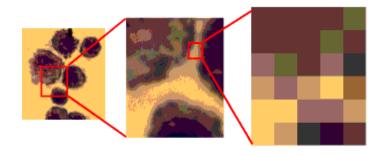

Resolution can be measured in many ways:

- 1. Samples per inch (spi, scanners)
- 2. Pixels per inch (ppi monitors)
- 3 Dots per inch (dpi, printers)
- 4. Lines per inch (lpi, slides and printing press)

More pixels in a given area will give you a smoother, more detailed image but it will also give you a much larger file.

Images in Photoshop are made up of units called pixels.

Resoloution is measured in pixels or dots per inch (ppi) or (dpi).

Choosing a resolution depends on how you will use your image. 300 dpi is safe for most printing, while web images are only 72 dpi.
